

NEXT-GENERATION AUTOMATION  
FOR FLAWLESS  
BUSINESS PROCESSES

**DP World Yarımca**

## Current State

DPWorld Yarimca Facilities have to track manually the multiple conditions such as observing the weather conditions in the tracking and positioning of the containers, determining the position of the containers in the port, processing and operating various data that need to be taken from different locations via web services, daily, hourly or even minute data were created and measured in a way that created a serious workload and risk for the employees.

## Robusta's Solution

Robusta has automated the tracking of placement of containers carried out in the port operation and monitoring processes that prevent the formation of high-risk container chimneys. With this structure, the formation of container chimneys were captured, and the alarms were generated for the related units and the possible risks could be prevented. The lack of complete and incorrect data container in order to begin the process of customs is very important. With the automation created with Robusta, this data is processed completely and data errors in these entries are prevented. In the event of the slightest mistake of information, customs procedures are prolonged and there is a serious cost loss.
